Pipeline 25-Px Ascend's Dynamic IP Access (ADIA)

- Pipeline 25-Px dials into an ISP POP (or a corporate central site) with address "A"
 - on the workstation and address "B" on its Ethernet interface
- ▲ The POP assigns address "C" from a pool of available addresses to the WAN interface of the Pipeline 25-Px
- Pipeline 25-Px uses ADIA to switch between addresses "B" and "C" to pass traffic from the workstation's IP address "A" to the network and back from the network to the workstation
- ▲ ADIA is not proprietary it works with Pipeline 25-Px to Ascend, or Pipeline 25-Px to other vendors' products
